Models and Data for All Hazards – introducing TDIS

Overview of Texas Disaster Information System
& a discussion of our initial use case

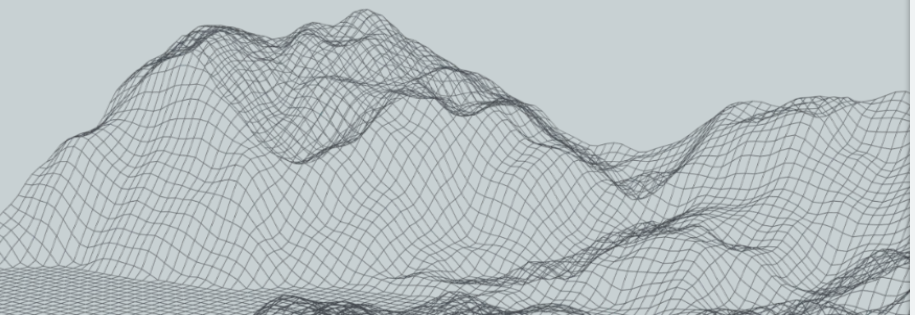
March 9, 2022

AGENDA

TNRIS Forum

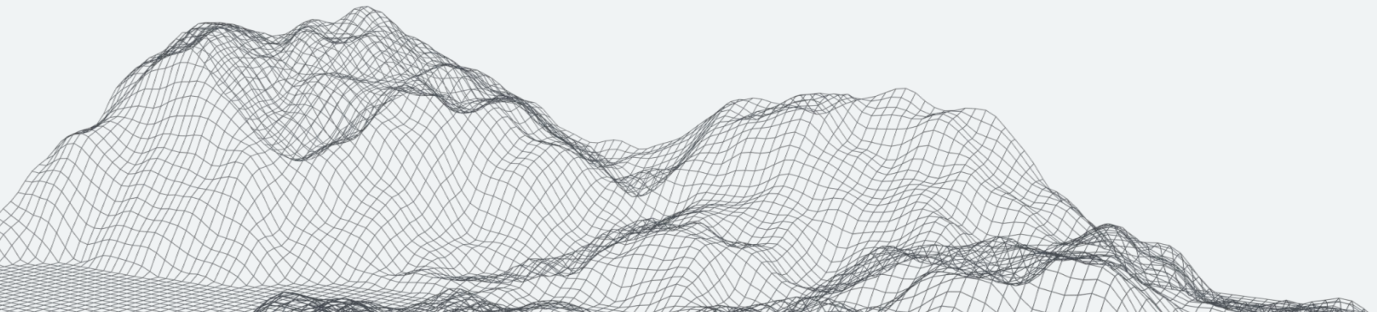
March 9, 2022

5 minutes	Introducing IDRT & TDIS
5 minutes	TDIS Design Concepts & Approach
5 minutes	Use case Discussion
5 minutes	Discussion / Wrap Up



INSTITUTE FOR A DISASTER
RESILIENT TEXAS

The cornerstone project for the Institute is the Texas Disaster Information System (**IDRT**). This project is currently its initial implementation phase, but will be an interactive, analytical, and visual web-based spatial data system designed to support more resilient decision making at the state level.

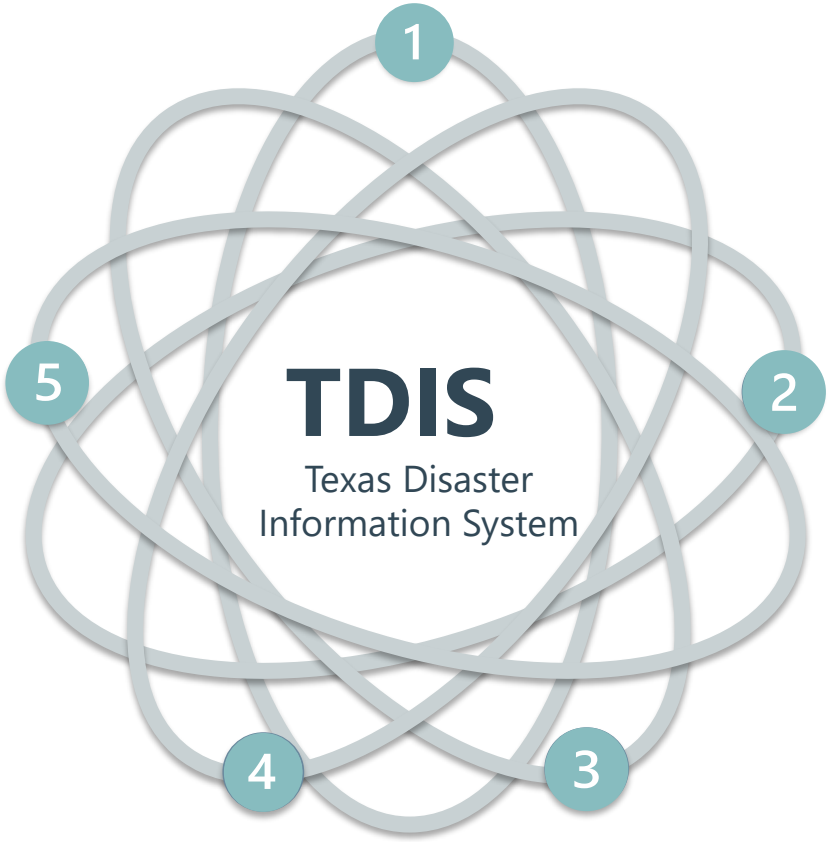


INSTITUTE FOR A DISASTER RESILIENT TEXAS

The cornerstone project for IDRT is the Texas Disaster Information System (TDIS).

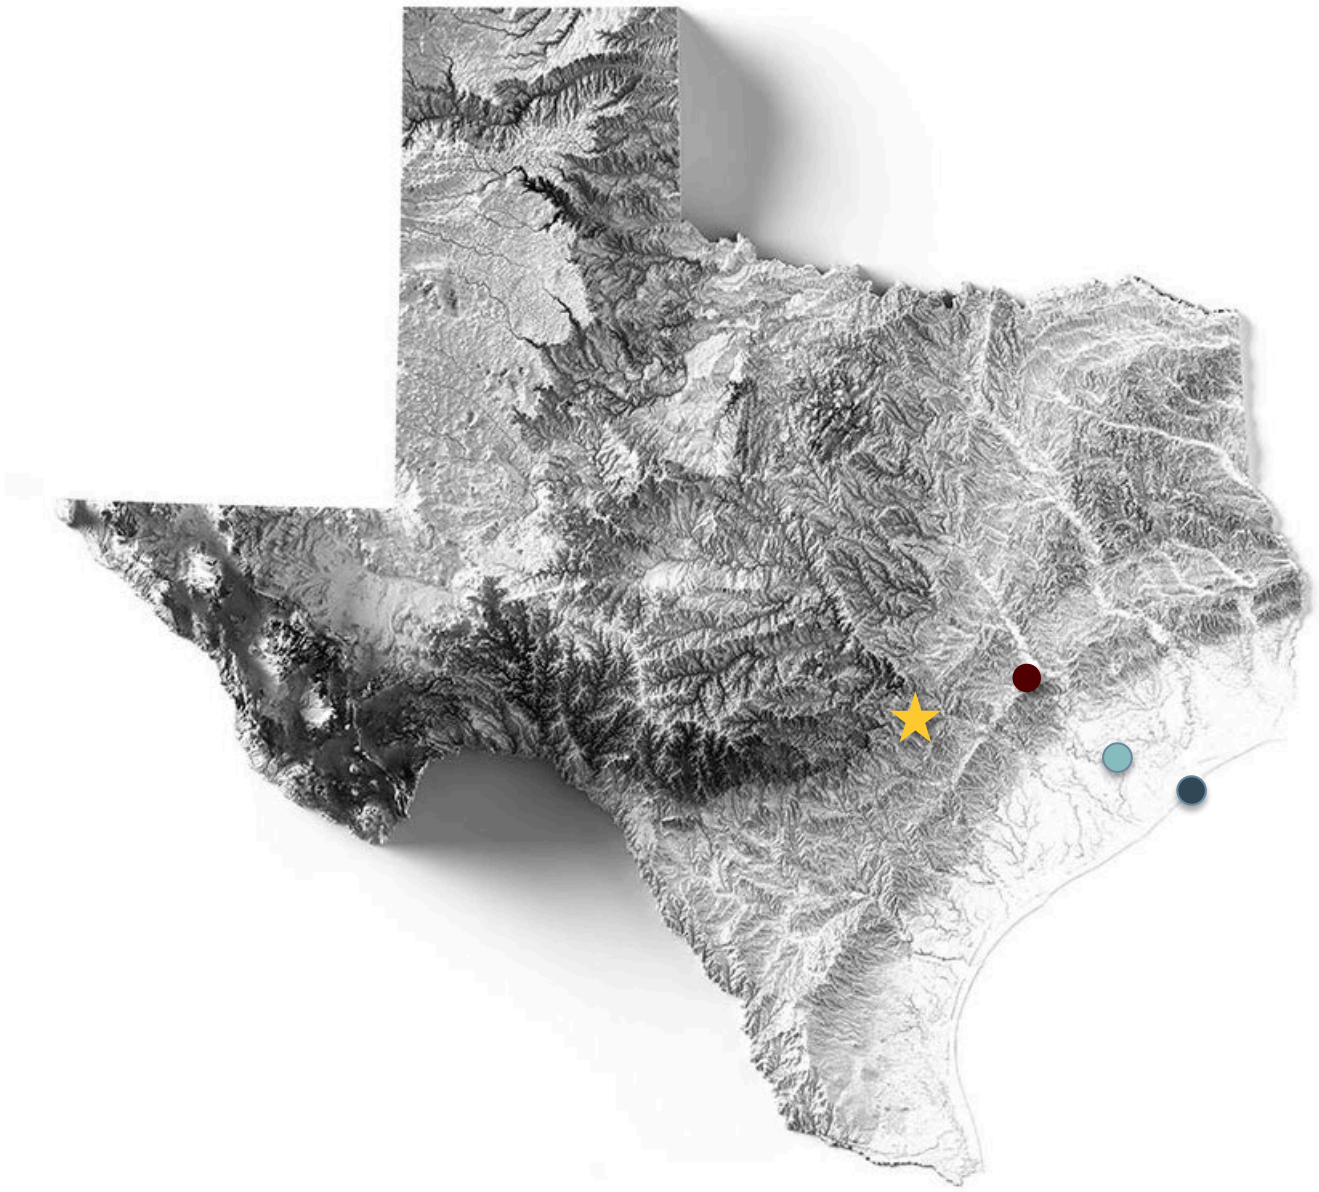
IDRT Program Areas

1. Hazard Analytics
2. Risk Communication & Perception
3. Policy & Decision Support
4. Education
5. Coastal Risk Reduction



Sam Brody, PhD
IDRT Executive Director
sbrody@tamug.edu

Suzanne A. Pierce, PhD
TDIS Director
spierce@tacc.utexas.edu



Logistics & Operation

We are transdisciplinary and multi-institutional with funding from project-based grants/contracts and indirect return.

- **Created by TAMU System**
- **IDRT is located in Houston**
- **Administration based at TAMUG**
- **Partnered with UT Austin (TACC, CSR, Oden)**
- **Acts at the State-Wide Level (and beyond?)**

TDIS DRAFT Living Plan Version 1.0 has Published

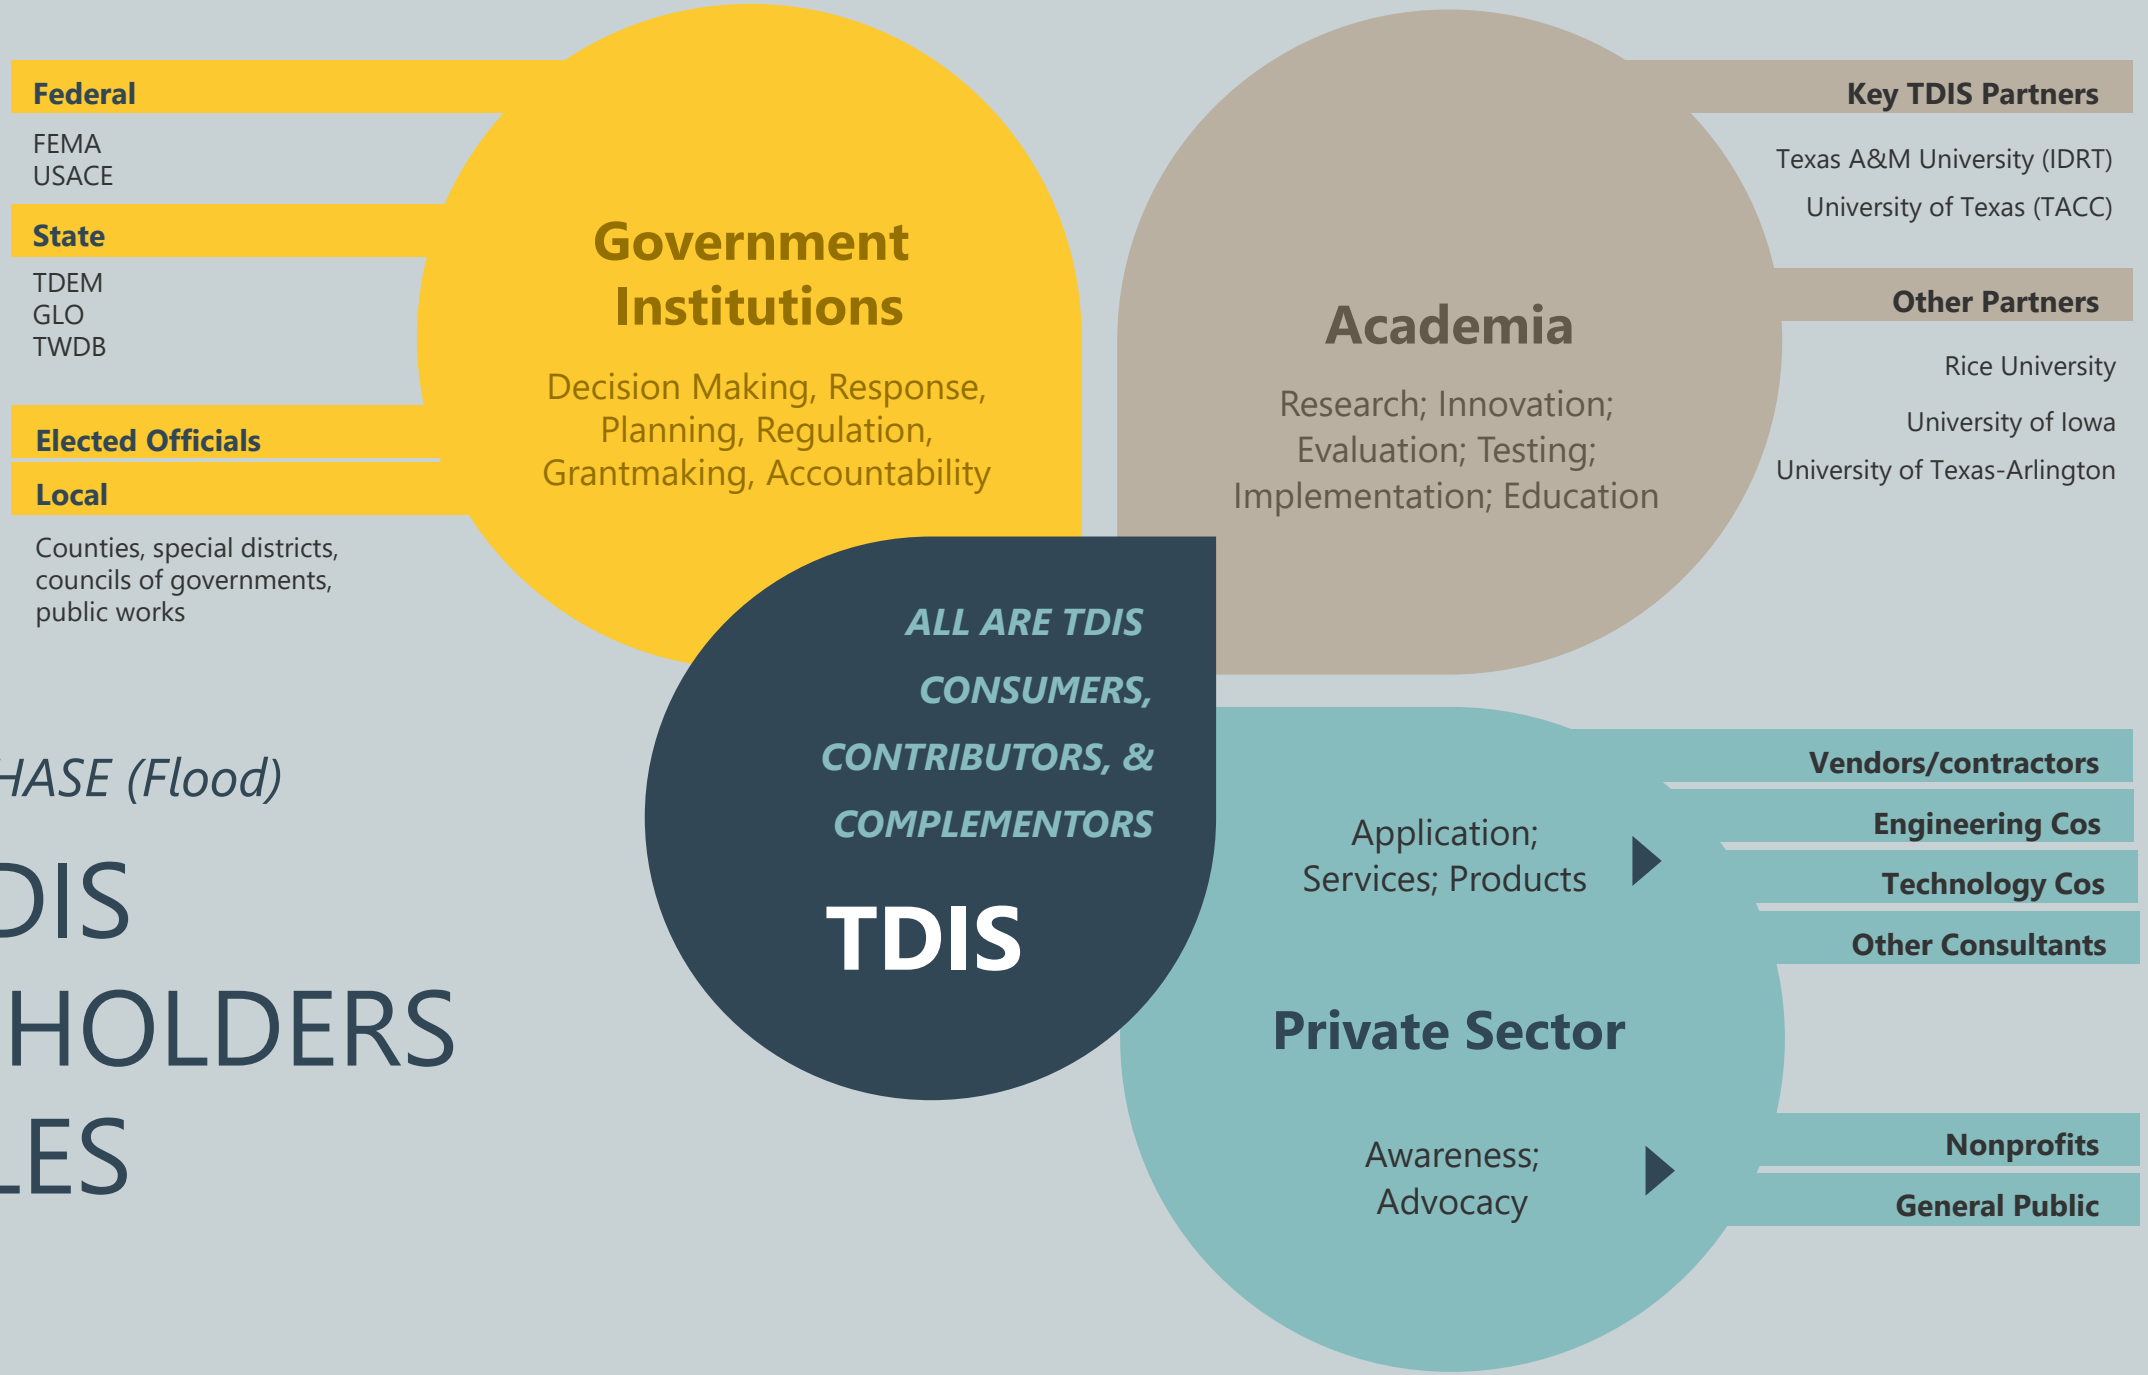
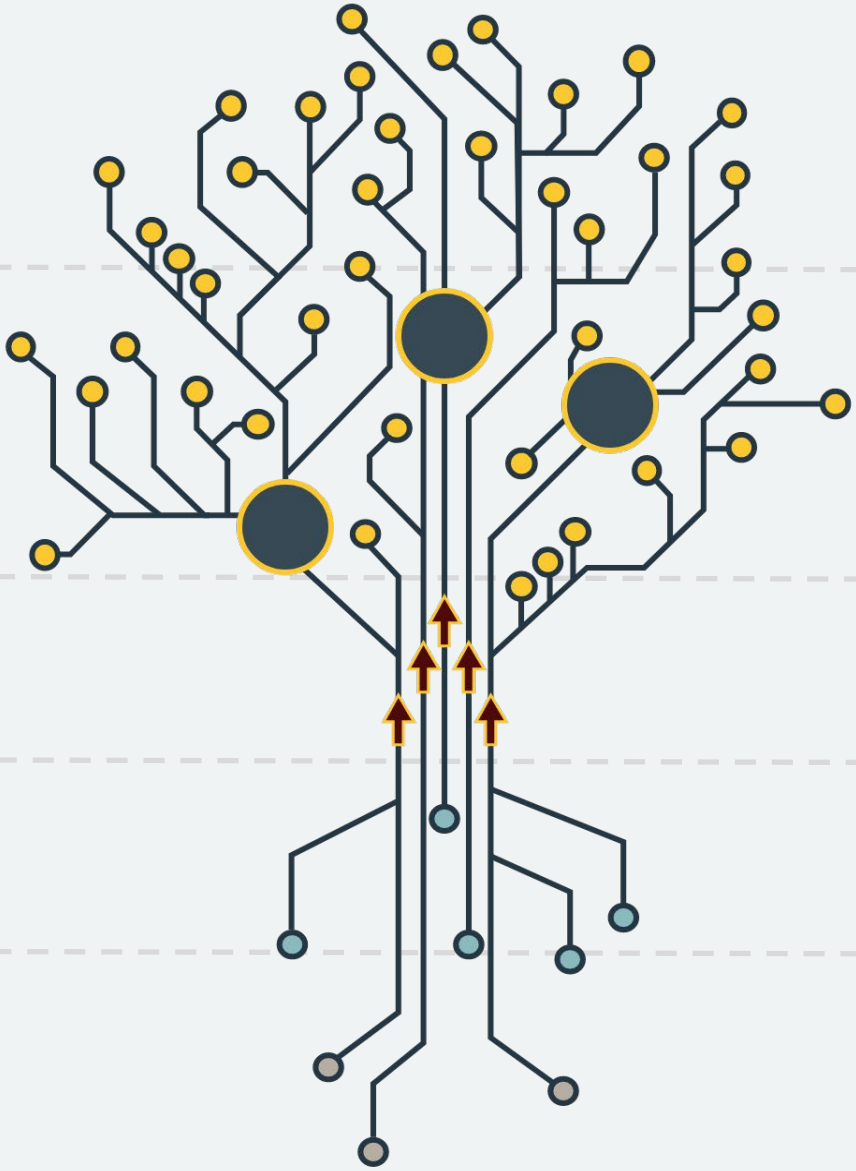
CURRENT PHASE (Flood)

KEY TDIS STAKEHOLDERS & ROLES



Refining the TDIS Knowledge Ecosystem

- **Smart Data**
- **Knowledge**
- **Information**
- **Data**
- **Resources**



Interactive Analytics

PROBLEM FRAMES

MODEL CATALOG

DATA CATALOG

SECURE DATA PROCESSES

TDIS Conceptual Architecture To Implementation

Defines data domains by hazard type

Distinguishes Thresholds

- Data-to-Information
- Information-to-Knowledge

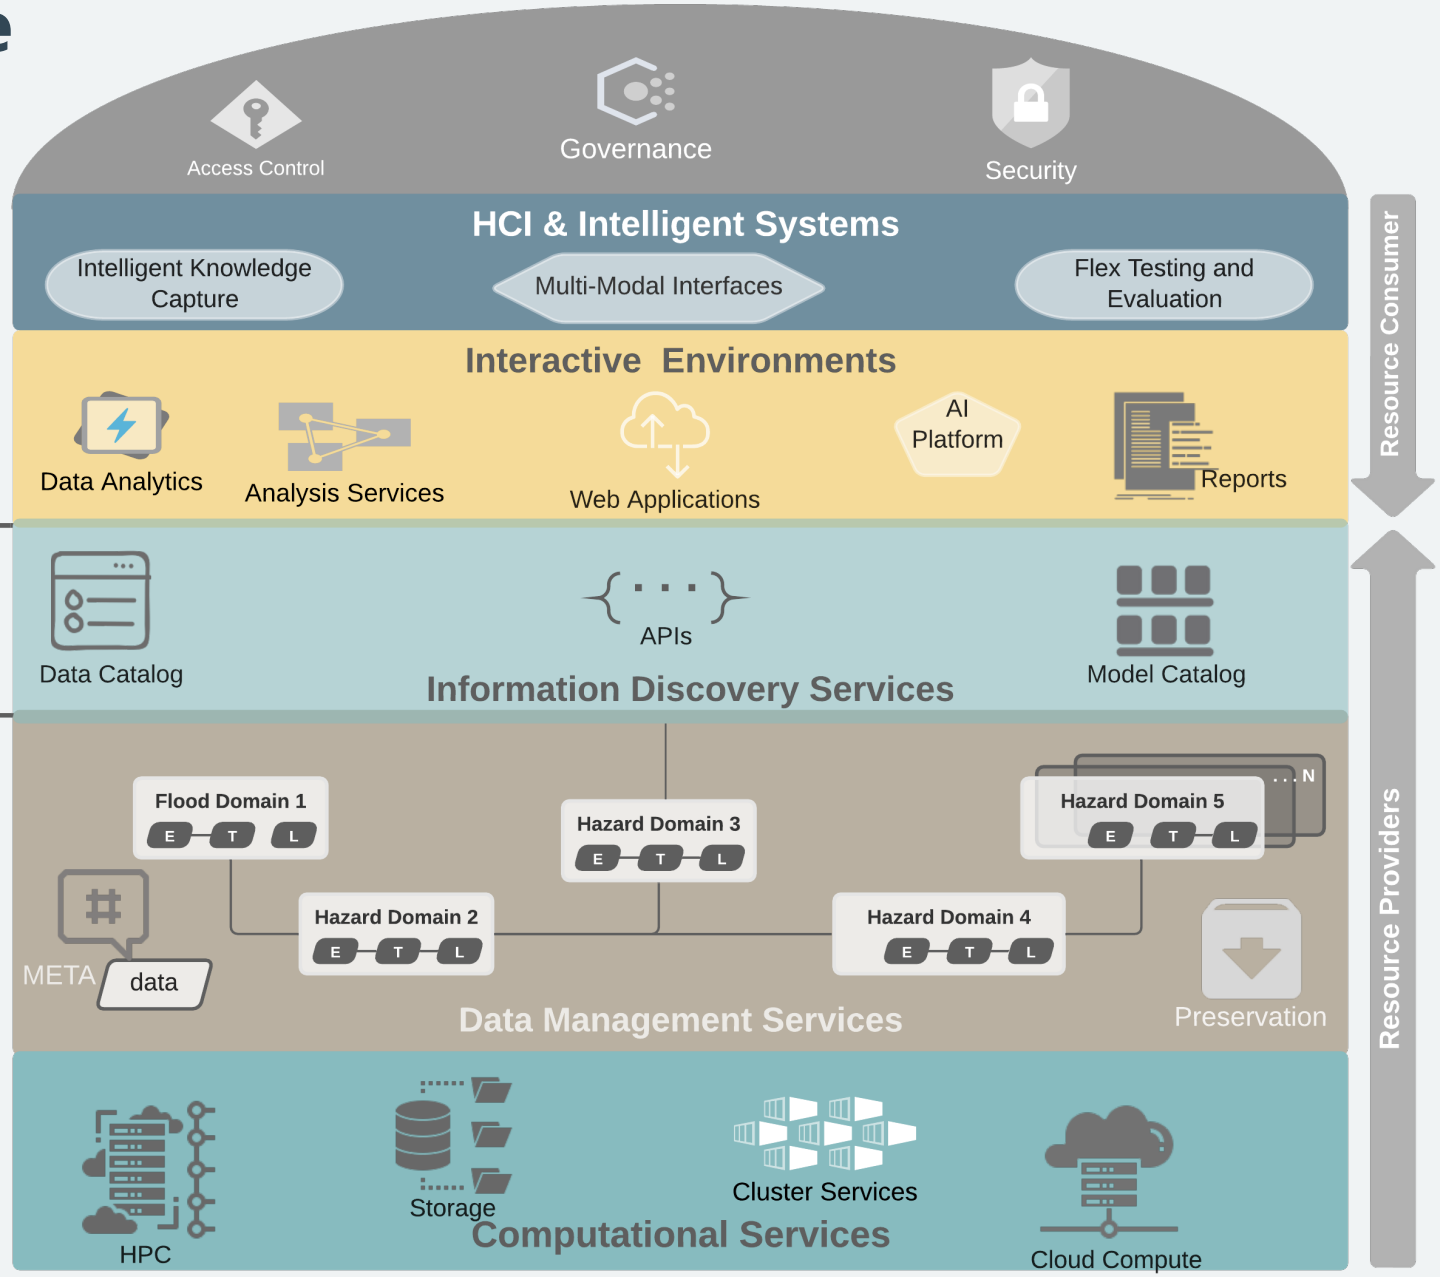
Design will consider multiple strategies to manage

- Data-proximate computing
- Hybrid compute services
- Processes to define data models
- Data registration tiers
- Reusable workflows & algorithms
- Usability and flex test protocols
- Cross-organizational security

Knowledge

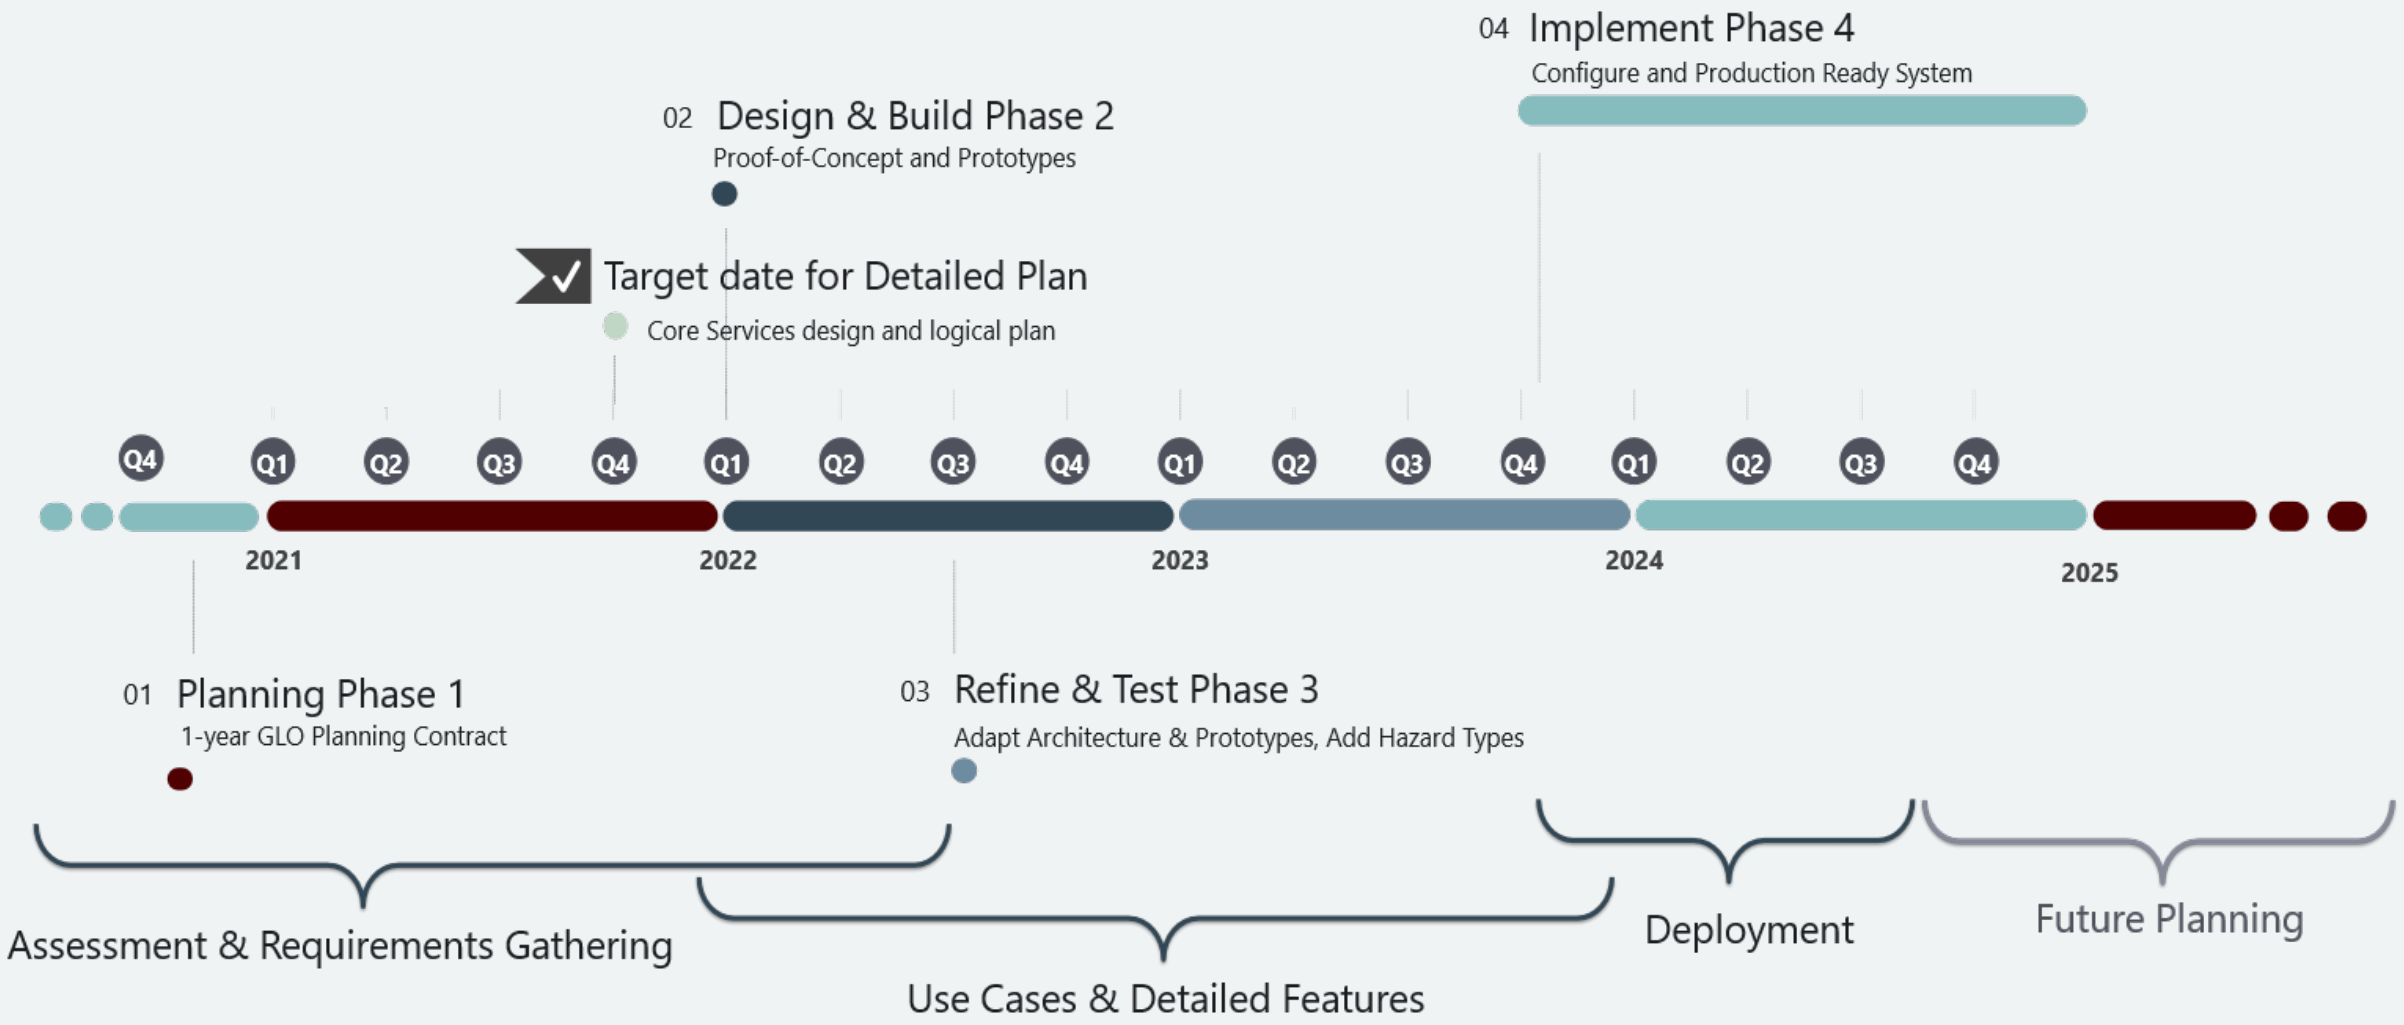
Information

Data



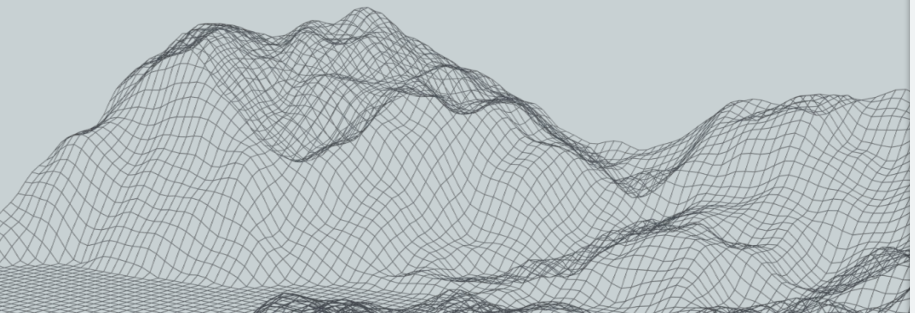
TDIS Development Timeline

TDIS adopts an iterative and agile approach to development.



Remember -
TDIS
is an
All Hazards System

But
the INITIAL FOCUS
is Flooding



Hazard Types

Flooding as initial focus hazard…

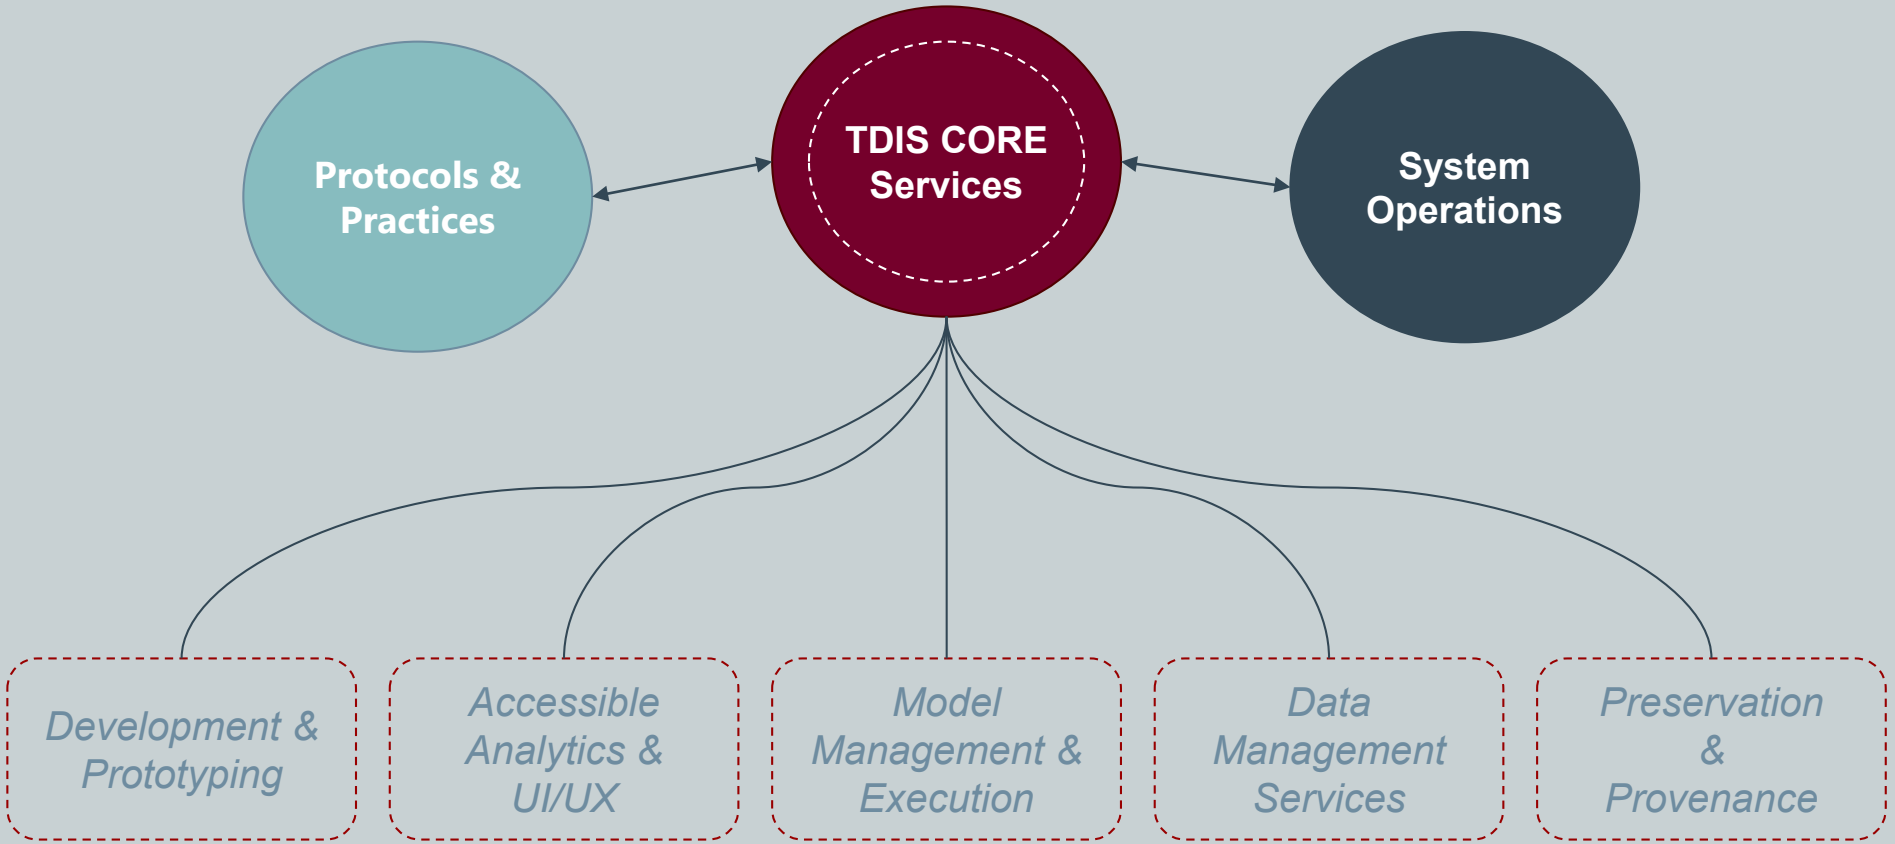
… then add and iterate into the eventual all-hazards system.

Disaster Domains/ Use Cases

Start with a focus on *direct tie-ins* to existing **planning and mitigation** programs**…**

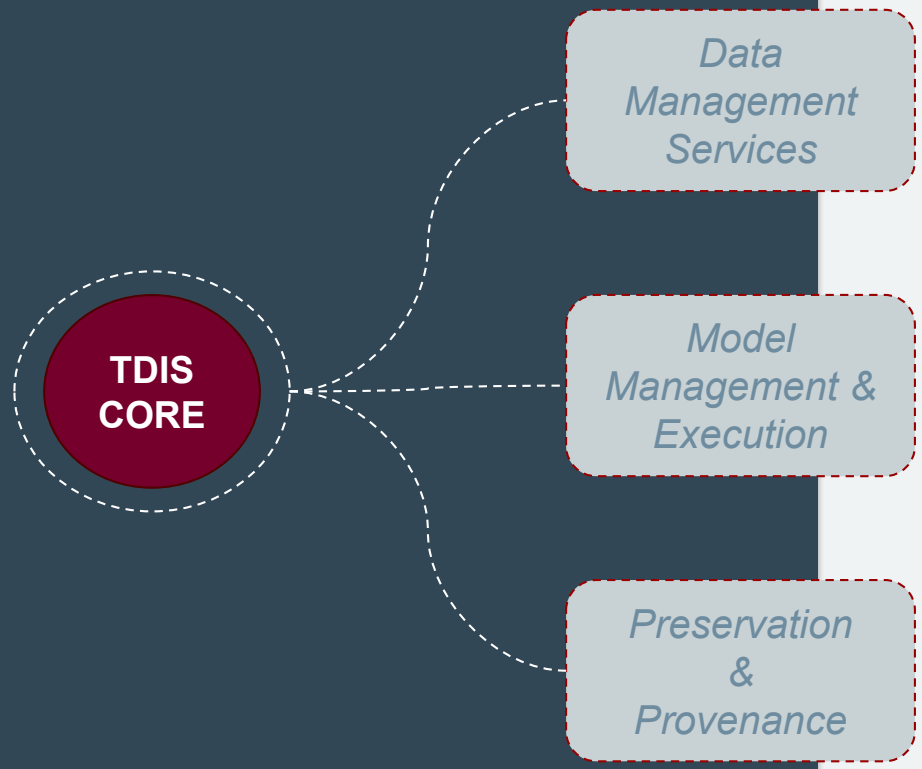
… with intention to *support* recovery and response.

Core TDIS Services Breakdown



TDIS Ecosystem

Implementation 0-18 months

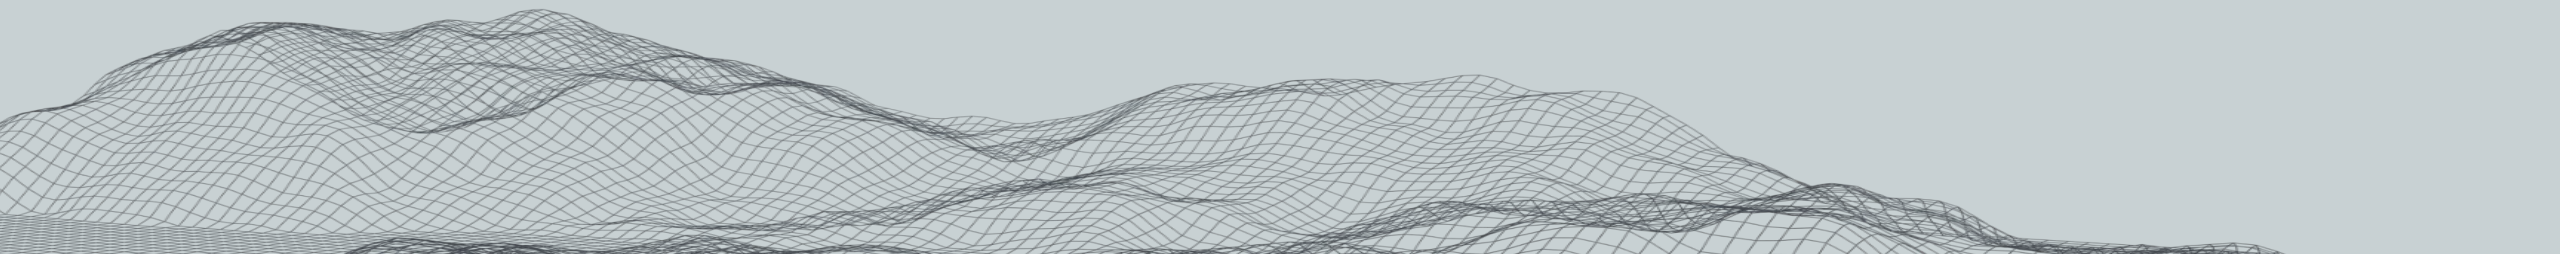


Use Cases

- Domain problems drive the use case selection
- Initial implementation includes straightforward examples
- Early use cases tightly connected with feature requirements
- Initial use case have arisen organically
  future use cases will be selected using a rubric or SOP

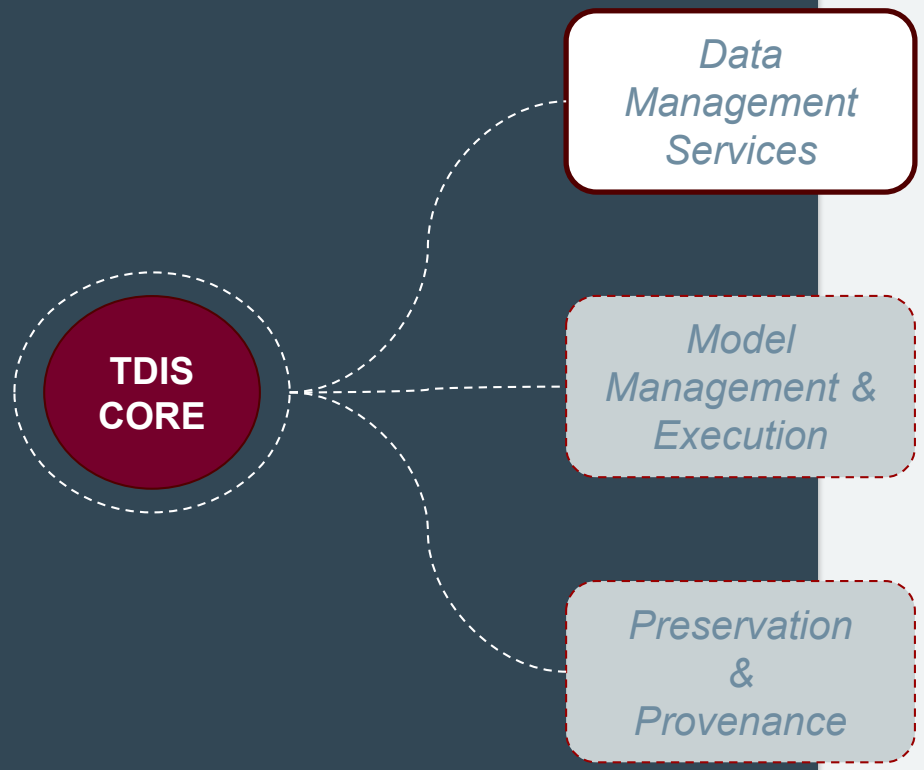
Introducing - Model Management System (ms2)

- **Project in co-development (TWDB Team, headed by Reem Zoun)**
  - Flood Planning Coordination with TWDB
  - Assist with flood model metadata descriptions
  - Develop a model & data indexing service for both regional and central TWDB staff for registering and uploading models and associated data



TDIS Ecosystem

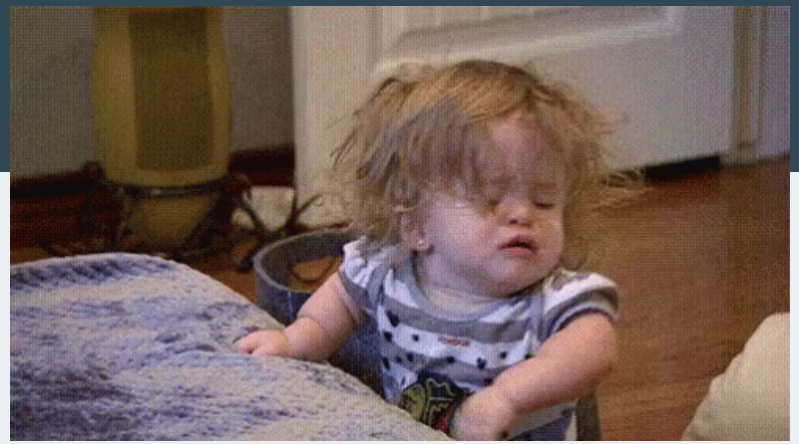
Implementation 0-18 months



MS2 Use Case - details

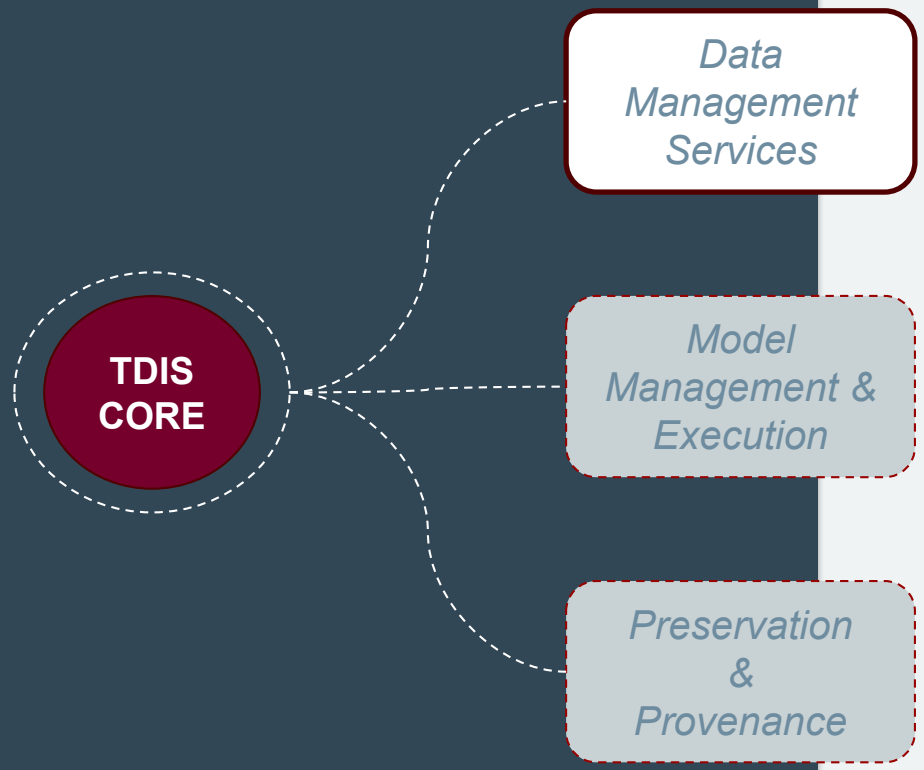
- In Flight right now – user testing begins in **April!**
- Provides mechanisms to register metadata through a user interface
- Provides means of uploading very large archives of data to TDIS file system
- Provides TWDB Staff the means of visualization files and directory structure and validate models and associated files through online web application
- **But to really discuss the system we need to discuss metadata for a bit…**

Metadata???!!!???



TDIS Ecosystem

Implementation 0-18 months



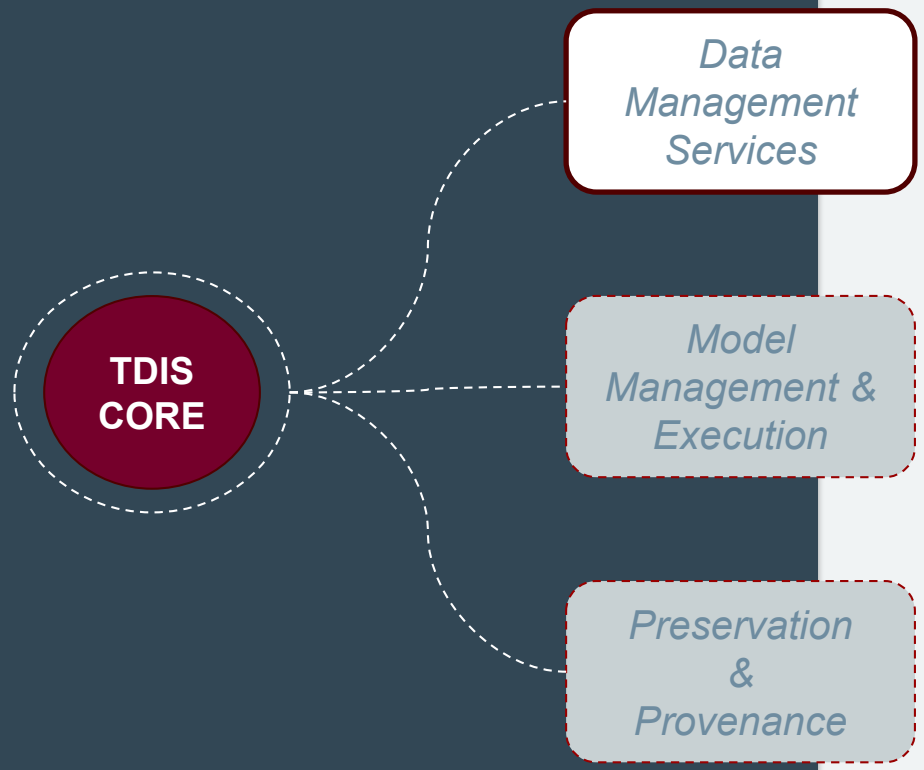
MS2 Use Case – details

No really - Its all about the metadata!

- **Our working metadata specification provided the basis of our TDIS DB Data model – published here https://github.com/TexasDIS/metadata**
- **That data model has provided development teams with a basis for discussions on workflows and synergy**
- Having the metadata also provides a starting point for how TDIS is categorizing problem spaces. And then the comparison of that problem space with collaborators.

TDIS Ecosystem

Implementation 0-18 months



MS2 Use Case – details

It's all about the metadata!

- **The basis of the model is a Collection – a logical construct that could take the form of a project, spatial extent, or any other grouping of files.**
- **Collections gather Layers, Models and Artifacts**
- **The specification is published for each of the digital objects**
- **Each of these then provides a starting point for building workflows with partners and projects. Having the specification transparent means that others then can map or have us map their information to ours. This business model has provided novel and emergent use cases for future development**

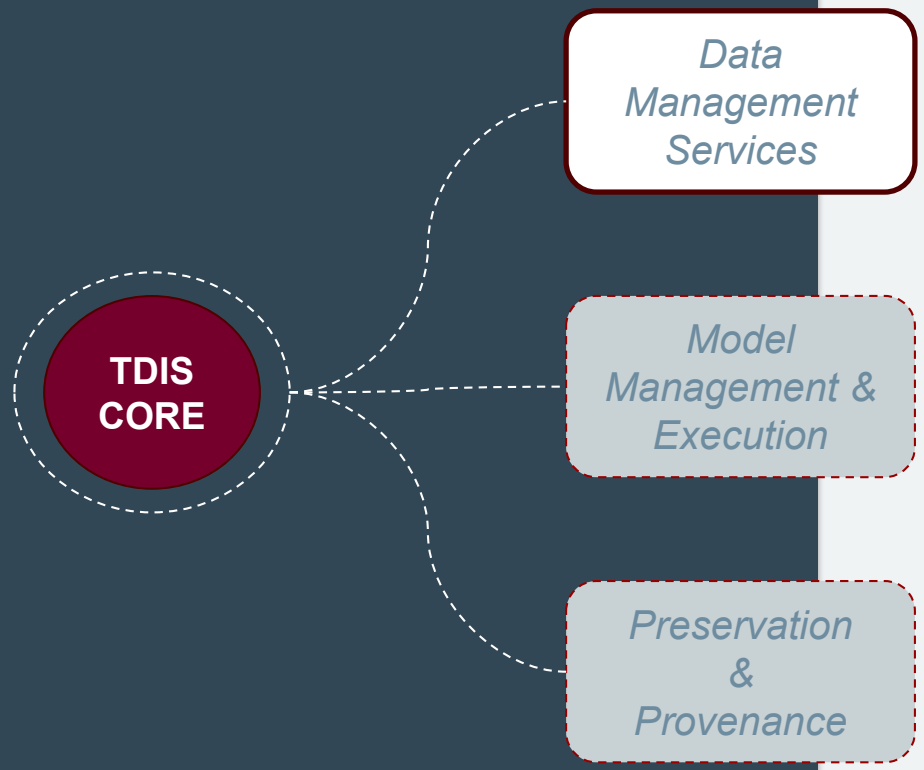
TDIS Metadata and Data Assessment
This repository contains public documentation of the TDIS metadata schema under ongoing development.
Please note: field definitions will become more rigorous over time, and TDIS controlled terms are expected to expand as lists or hierarchies of valid terms.

Metadata

	status	metadata_level	metadata_group	display_name	definition
1	Core	Model	Access	Distribution Method	A statement describing the method of distribution and access provided by the Distributor or Publisher.
3	Core	Model	Access	Distribution URL	The URL where the digital object can be accessed via a service endpoint, API, etc.
0	Core	Model	Access	Distributor or Publisher	The organization sharing, publishing, or otherwise responsible for providing access to the digital object.
2	Core	Model	Access	Service Endpoint Type	The type of service endpoint used for distribution.
59	Core	Model	Administrative	Collection Identifier	The TDIS unique identifier for the associated collection.
8	Core	Model	Administrative	Date Created	Date the digital object was originally created. Must conform to the ISO 8601 standard.
4	Core	Model	Administrative	Date Last Updated	The date the digital object was last updated. Must conform to the ISO 8601 standard.
12	Core	Model	Administrative	Date Metadata Updated	Date the metadata record was last updated. Must conform to the ISO 8601 standard.
9	Core	Model	Administrative	Date Submitted	Date the digital object or metadata record was submitted to TDIS. Must conform to the ISO 8601 standard.
5	Core	Model	Administrative	Identifier	The TDIS unique identifier for the digital object.

TDIS Ecosystem
Implementation 0-18 months



MS2 Use Case – details
OK – AND also about the data

- Another important aspect of TDIS is the ability to provide storage and bandwidth for uploading and downloading very large file archives
- Building out a workflow to provide these services to partners has also provided us with opportunities with other partners.
- Very large archives (> 7GB) are hard to *shove around* on the internet. SO, this service becomes a useful starting point in attracting interesting to TDIS
- A little about the solution – I am using java, the S3 API and another API MinIo to orchestrate the stable transfer of 20-30 GB archives

TDIS Ecosystem

Implementation 0-18 months

Other Use Cases – in dev or upcoming

GLO Regional Flood Studies

In progress

1. Collect and ingest datasets and digital objects from 4 regions.
2. Coordinate with GLO Vendors to design features and capabilities.
3. First data services test cases.

State Hazard Mitigation Plan

- **Project is in-flight**
  1. Collect and store high quality hazards data and metadata attributes.
  2. Develop a statewide relational hazards database.
  3. Perform statewide hazard exposure, vulnerability, and risk assessments.

Data Inventory & Matching Service with TIFF

- **Project is in co-development (Sam Rendon at USGS)**
  1. Develop data inventory metadata services.

Thank you!
